String

public final class **String**

extends [Object](#)

implements [Serializable](#), [Comparable<String>](#), [CharSequence](#)

The String class represents character strings. All string literals in Java programs, such as "abc", are implemented as instances of this class.

Strings are constant; their values cannot be changed after they are created. String buffers support mutable strings. Because String objects are immutable they can be shared. For example:

```
String str = "abc";
```

is equivalent to:

```
char data[] = {'a', 'b', 'c'};
```

```
String str = new String(data);
```

(<https://docs.oracle.com/javase/8/docs/api/java/lang/String.html>)

```
public static void primitive_data() {  
    int a = 10;  
    int b;  
    b = a;  
    System.out.println(a + " " + b); //10 10  
    char ca = 'a'; //2byte = 16bit = 2^16, 0 ~ 2^16-1  
    System.out.println((int)ca); //97  
    ca++;  
    System.out.println(ca); //b  
    System.out.println((char)98); //b  
    System.out.println((char)0x62); //b  
    String sa = "String 1";  
    String sb = "String 1";  
    System.out.println((sb == sa)); //true  
    String sc = new String("String 1");  
    System.out.println((sc == sa)); //false  
}
```

```
public static void loop() {  
    for(int i = 0; i < 10; i++) {  
        System.out.print('*');  
    }  
    System.out.println();  
}
```

```
int i = 0;  
for(; i < 10;) {  
    System.out.print('*');  
    i++;  
}  
}
```

Scanner class

<https://docs.oracle.com/javase/8/docs/api/java/util/Scanner.html>

- Scanner generation
 - `import java.util.Scanner`
 - `Scanner myScanner = new Scanner(inputStream(System.in));`
- Scanner usage
 - `String myString = myScanner.next();`
 - `String myString = myScanner.nextLine();`
 - `int myint = myScanner.nextInt();`
 - `double mydouble = myScanner.nextDouble();`

```
public static int scan_example() {  
    Scanner scan = new Scanner(System.in);  
    System.out.print("Type int: ");  
    //int read = scan.nextInt();  
    int read = Integer.parseInt(scan.nextLine());  
    System.out.println(read);  
  
    /*  
        //scan.nextLine();  
        System.out.print("Type some word: ");  
        String line = scan.nextLine();  
        System.out.println(line);  
    */  
    return read;  
}
```

To do

Write a method that will print pattern depending on variable and return how many times loops have ran

Pattern for 2

A diagram of a 2D hexagonal lattice. A central hexagon is highlighted in red. It is surrounded by six other hexagons, which are arranged in a ring around the center. The entire structure is enclosed in a square frame with a thick black border.

Pattern for 3

Pattern for 4

Pattern for 5

```
public static void main(String[] args) {  
    System.out.println("loop count: " + to_do(scan_example()));  
}
```

```
public static int to_do(int size) {  
    int count = 0;  
    return count;  
}
```

Prime, perfect, Fibonacci prime, Mersenne prime

Perfect Number: A positive number which is the sum of its proper positive divisors.

ex) $28 = 1+2+4+7+14$

Fibonacci Prime: A prime number which is also fibonacci number.

ex) 13 is a prime and fibonacci number [1, 2, 3, 5, 8, 13]

Mersenne prime: A prime number which have 1 less value than power of 2.

ex) $31 = 2^5 - 1$

Practice 2

Problem: Given a number “N”, print how many perfect num, fibonacci prime, mersenne prime in [1 ... N] where format is like [4, 3, 2] and then print what numbers are perfect num, fibonacci prime, and mersenne prime line by line.

[Input] : int N

[output] :

[pe, fi, me]

[pe1, pe2 ... pe_y]

[fi1, fi2, ... fi_z]

[me1, me2, ... me_t]
